

Use App ID (Client ID):

1. Application Registration:

- When registering an application in Azure AD, use the App ID (Client ID).
- The App ID uniquely identifies the application among registered applications.

2. Configuration in Confluent Platform:

- When configuring Confluent Platform to integrate with Azure AD, provide the App ID.
- App ID is used to establish trust and secure communication.

3. Authentication Credentials:

- App ID is part of the credentials used for authentication between the application and Azure AD.
- It ensures secure communication and proper identification.

Use Object ID:

1. User and Group Mappings:

- In Confluent Platform or other systems, use the Object ID for user and group mappings.
- Object ID uniquely identifies users, groups, or service principals in Azure AD.

2. JWT Token Claims:

- In JWT tokens issued by Azure AD during authentication, the Object ID may be included as a claim.
- It represents the unique identifier of the authenticated user or service principal.

3. Directory Object References:

- When making API calls or referencing directory objects in Azure AD, use the Object ID.
- Object ID uniquely identifies each object (user, group, etc.) within the directory.
